EDUCATION

Yadegar-e Emam University

B.Sc. in Software Engineering

Iran, Tehran

2024-11 - Present

EXPERIENCE

Mid-Level Backend Developer

2024-11 – 2025-03

TeleVisit24

Tehran, Iran

- Built a full-stack telemedicine platform (Django, DRF, PostgreSQL, Redis, Next.js) covering patient, doctor, and admin-facing workflows end-to-end.
- Designed RESTful APIs for appointment scheduling, doctor profiles, and healthcare workflows, replacing manual coordination with automated booking logic.
- Implemented real-time patient-doctor communication using Django Channels and WebSockets, and integrated FastAPI-based AI microservices for disease prediction and emergency detection.
- Implemented JWT authentication and role-based access control across the platform's API surface, and deployed production services via Docker and Cloudflare Tunnel with secure HTTPS delivery.

Backend Developer Intern

2023-11 – 2024-05

Kelaasor

Tehran, Iran

- Built backend features for a Django-based bootcamp management platform covering student, ticketing, and administrative workflows.
- Implemented RESTful APIs for registration, SMS verification, ticketing, and messaging across the platform's core operations.
- Built role-based access control with Django Groups, separating permissions for technical vs. financial administrators to prevent unauthorized access to sensitive operations.
- Integrated Celery for asynchronous SMS notifications and alerts, and designed database models supporting scalable user management as the platform grew.

PROJECTS

Coxy — github.com/TIROK547/coxy | *Python, Telegram API, Asyncio*

- Built a Python automation pipeline (collect → test → rank → publish) that scrapes, validates, and ranks VLESS/VMess/Trojan configs and proxy servers from Telegram channels, with concurrent connectivity/latency testing and a CLI to run stages independently.
- Powers a live Telegram channel with 350+ subscribers, auto-publishing ranked, ready-to-use configs.

OTP-Go — github.com/TIROK547/otp-go | *Go, PostgreSQL, Redis, Docker*

- Built a Go authentication service issuing OTP-based logins with atomic Redis-backed rate limiting to prevent brute-force abuse, and RESTful APIs with JWT auth and OpenAPI docs.
- Split state across Redis (ephemeral OTP/rate-limit data) and PostgreSQL (durable user records), containerized with Docker Compose for one-command local dev.

Telegram Study Bot — github.com/TIROK547/telegram-study-bot | *Python, aiogram*

- Built a Telegram bot for tracking study sessions with a Farsi-localized UI, native Persian (Shamsi) calendar support, and leaderboard ranking to drive engagement.

OPEN SOURCE CONTRIBUTIONS

- **cognee** — merged PR: return type hints across core API functions *Feb 2026*
- **Bushuray-core** — merged PR: configurable URL ping-testing feature *Jul 2026*

TECHNICAL SKILLS

Languages: Python, Go, JavaScript, TypeScript, SQL

Frameworks: Django, Django REST Framework, FastAPI, Gin, Next.js, React, Tailwind CSS

Databases & APIs: PostgreSQL, Redis, Valkey, REST API, WebSocket, JWT, OpenAPI/Swagger, OAuth, Celery

DevOps & Tools: Linux, Docker, Docker Compose, Git, Nginx, Cloudflare Tunnel
